HORIZONTAL AND VERTICAL HEATING AND VENTILATING UNITS

SINGLE FAN UNIT
WITH V-TYPE
FILTER BOX

TWO FAN UNIT
WITH FLAT
FILTER BOX

DOUBLE WIDTH
TYPE F FAN

DOUBLE WIDTH
TYPE B FAN

THE STANDARD BASIC DESIGN of the various component parts provides combinations which can be selected for any heating and ventilating requirements. A wide variety of arrangements is available. The horizontal arrangement is more common. A base section incorporating a plenum and heating coil in conjunction with a standard fan head results in a vertical unit. The various combinations which may be used are outlined on Page 22. Units larger than the standard sizes covered in this catalogue are available on request. THE MULTI-ZONE UNIT provides individual zone control utilizing a single central station unit. An internal by-pass is used to supply zones requiring a lower temperature.

Standard Z-clips are used for both floor mounting and suspended units. Floor legs are available in addition for both horizontal and vertical arrangements. Flanges on the component parts are turned outward so that they are fitted directly to the coil section.

THE FAN HEAD may use either Sheldon Type "F" fans with forward curved blades or the Type "B" fan with backward blades. The forward-curved blade delivers the air at a relatively low running speed. This in itself does not result in low air noise, but in many cases the low operating speed is preferred in order to minimize the mechanical noise associated with higher rotative speeds. The backward-bladed "B" fans features the well-known limiting horsepower characteristic which eliminates the possibility of overloading the motor. All Sheldon fans for H & V units are balanced statically and dynamically on one of three electronic balancing machines. This fan head section may be used on a return air system, as fresh air supply or as an exhauster in place of centrifugal fans.

BEARINGS

SKF permanently lubricated pillow block ball bearings are standard on all H & V cabinets. Other bearings may be supplied if specified.

INSULATION

These units may be insulated with standard 1/2" or 1" fibreglass insulation. This is coated insulation that will not spall off at any normal air velocities. Fan head insulation has the added benefit that it results in sound attenuation of about four decibels on the downstream side of the fan. Insulation is optional on the draw-through units and is standard on the multi-zone units.

THE BELT GUARD is removable. The maximum projection of the guard on any Sheldon unit is given in the dimension tables.

MIXING BOXES are available as standard style or in combination as a filter-mixing box. The space-saving combination box may use either inlet for fresh or re-circulating air.

THE EVEN-TEMP MIXING BOX can be used in conjunction with the H & V units where minimum stratification of air is a necessity. This is fully described page 23.

FILTERS of several types are offered as standard equipment. Angle filter boxes are used to provide increased filter area; the flat filters are for high velocity types and lower capacities. All filter boxes are designed to accommodate standard filter sizes.

AN ACCESS SPACE may be provided for access to the coils or for the installation of control equipment. It may be provided with access at one end only or at both ends.

DAMPERS are available as face and by-pass dampers, face dampers only, or by-pass dampers only. The H & V units are offered with the internal by-pass as standard. **CUT-OFF DAMPERS** are sometimes installed with the Type "F" wheel for use on start-up to prevent motor overload. They can be left in a partially closed position when operating at low capacities. This damper control is used when operating in the area indicated at the top of each of the "F" fan rating tables. **PROPORTIONING TYPE DAMPERS** are available and should always be installed downstream from the heating coil.

VIBRATION ISOLATION

Spring isolators may be used for ceiling suspension or floor mounting of units as illustrated. Rubber-in-shear mounts are also used for hanger or floor mountings. One type of rubber-and-cork mounting is shown in conjunction with the adjustable motor base.

DISCHARGE COWLS

Standard discharge cowls are available for H & V units with 45° and 90° discharge elbows. Where directional controls are required a swivel elbow provides adjustment through 360°. This may be fitted with one or two sets of directional outlet deflectors.

HUMIDIFIER

The mist-type fan head humidifier is offered as standard equipment on H & V units. It will result in moderate humidification. Where a higher rate of humidification is required it is recommended that either a steam grid humidifier or a steam pan humidifier be used. The steam grid humidifier is used primarily for process applications. The pan-type humidifier consists of a pan, copper tubing, float valve, make-up, overflow and drain connections.

CONSTANTS for obtaining Temperature Rise at various Steam Pressures

Note: To obtain Final Temperature for Steam Pressures or Entering Air Temperatures other than those shown in Tables, multiply the ratings for Zero Entering Air Temperatures and 5 Pounds Steam Pressure as shown in the various Tables, by Conversion Factors given in this Table, and add this Temperature Rise to Temperatures of Entering Air.

| Ent. Air Temp. of F. | Steam Pressure in Pounds per Square Inch (Gauge) | | | | | | | | | | | | | | | |

GENERAL

All coils have galvanized casings with flanges which may be bolted directly to the adjacent sections, thereby forming an integral part of the unit. The copper tubing may have copper or aluminum fins as a helix around the tube. All steam coils are of the non-freeze design.

TYPE CH WATER COILS

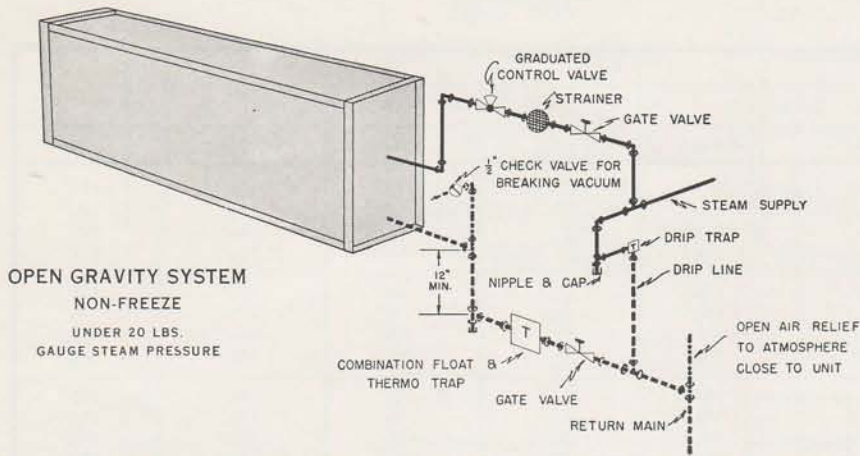

These coils are built with the supply and return connections at the same end of the coil. An air vent connection is also provided. Ethylene glycol (prestone) can be used in these coils, if protection is required against freezing air. The CH coil is available in one or two rows. These coils are slightly longer than the steam coils for the same cabinet, but all coils fit within the cabinet dimensions with no headers exposed. Means are provided to drain the coils whether installed in vertical or horizontal units. Single row coils are normally supplied $\frac{1}{2}$ circuit and 2-row coils are supplied full circuit. When CH coils handle air below freezing temperatures it is recommended that a circulating pump be installed in each unit system. The flow of water to the coil should not be throttled if freezing temperatures are encountered.

TYPE A STEAM COILS are available in single-row only. The tubing is 1" diameter. Several series are listed, all of which are available as standard. In all cases the coils are installed with sufficient pitch in both horizontal and vertical units to assure good drainage of condensate. The large diameter tubes provide excellent steam distribution over the entire face area and facilitate drainage.

TYPE B STEAM COILS are available in both one and two rows. The tubing is $\frac{5}{8}$ " diameter. These are also available in several series. Series W and X are recommended for textile mills and other applications where lint is present. The wider tube spacing permits foreign material to pass through more readily and facilitates cleaning.

COIL CONNECTIONS

NOTES ON PIPING CONNECTIONS

1. Do not bush return outlets of Heaters. Make connection full size of Heater Return, reducing at trap.

2. Use Thermostatic Traps for venting only and Float or Bucket Traps for condensate removal. Trap size should be selected on the Difference in Pressure between the steam supply main and the return main.

3. Do not use 45° or vertical lift Check Valves. Use only 15° Check Valves as they can open with lower head of water.

4. Do not drip steam mains into coil sections, drip them on pressure side of control valve and trap into return main beyond trap from coil.

5. Do not oversize control valve, select valve from steam load and not from coil supply connection.

6. Do not use a single trap for 2 or more coils installed in series unless entire bank is controlled by one valve. Each group or bank of coils under separate control must have a separate trap.

7. Do not try to lift condensate above coil return into overhead main, or drain into mains under pressure with modulating or on and off steam control valves. A pump and receiver or boiler return trap should be installed between coil condensate traps and overhead mains and return mains under pressure.

8. Do not fail to use strainer (3/32" Mesh) as shown by piping diagrams on steam supply side, to avoid collection of scale or other foreign matter in distributing orifices.

NOTE: Non-Freeze, laid flat for vertical airflow, must be installed with tubes draining downward toward the header end of the coil.

9. Do not fail to provide all coils with proper air vents to eliminate non-condensable gases.

10. Do not support steam piping from units. Both mains and coil sections should be supported independently.

FACTORS FOR ETHYLENE GLYCOL*

| Design Outside Air Temp. °F | F ₁ | F ₂ | Ethylene Glycol* Water Solution | |
|-----------------------------|---|--|---------------------------------|-----------------------------|
| | F ₁ X Water GPM = Solution GPM | F ₂ X Water Head = Solution Head (Ft. H ₂ O) | Freezing Point °F | % Ethylene Glycol By Volume |
| +20 | 1.06 | 1.00 | +10 | 28% |
| +10 | 1.09 | 1.15 | 0 | 36 |
| 0 | 1.11 | 1.15 | -10 | 43 |
| -10 | 1.25 | 1.55 | -20 | 47 |
| -20 | 1.40 | 1.90 | -30 | 52 |

Note: To select CH Coil using ethylene glycol solutions, read "K" from Curve Page 12 and calculate GPM and head loss as for water. Then apply factors F₁ and F₂. (Factors valid only if average solution temperature is above 150°F, with maximum temperature not over 300°). Consult supplier of anti-freeze for inhibitors for controlling corrosion.

*This is Prestone, Zerex or equivalent.

FORMULAE

GENERAL

CFM x 1.087 x Temp rise of air = Btu/hr heating load
 CFM x 4.495 = lb of air per hr.

$$MED = \frac{\Delta t_1 - \Delta t_2}{\log_e \frac{\Delta t_1}{\Delta t_2}} \quad \begin{array}{l} \Delta t_1 = \text{Greatest temperature difference} \\ \Delta t_2 = \text{Least temperature difference} \end{array}$$

$$\text{Coil Face Velocity} = \frac{\text{CFM}}{\text{Face Area}} \quad (\text{Face Area Table Page 13})$$

FOR WATER COILS

GPM (US) per tube x 1.235 = water velocity ft/sec

GPM (IMP) per tube x 1.48 = water velocity ft/sec

GPM (US) x 500 x temp diff (water) = BTU/hr

GPM (IMP) x 600 x temp diff (water) = BTU/hr

$$\text{Water Velocity} = \frac{\text{GPM (US)} \times 1.235}{N} \quad (N \text{ from Table Page 13})$$

$$\text{Rows Deep (Water Coil)} = \frac{\text{Total Heat}}{K \times \text{MED} \times \text{Face Area}}$$

K from Chart Page 12

MED from Chart Page 10 or Formula above.

SELECTION OF UNITS

1. Select a Sheldon H & V Unit to heat 8000 cfm from 0° to 100°F using steam coils. Steam is available at 5 psig. Coil face velocity—700 fpm. In this case, the unit may be selected directly from the Table on Page 8. A 2-H-13 unit will give approximately 700 fpm face velocity. The actual coil face area is obtained from the Table on Page 13. A full size steam coil has a face area of 11.6 sq. ft., giving a face velocity of 688 fpm. No Type "A" coil will produce a final air temperature of 100°F with this face velocity. A Type "B" coil (Table on Page 9), Series W₂ will give a final temperature of 102°F.

2. A Sheldon unit is to be selected to handle 4800 cfm at 1" SP heated from 30°F to 100°F using steam at 50 psig. Coil face velocity—600 fpm. The coil face area is 4800/600 = 8.0 sq. ft. From Table on Page 13 select a 1-H-16 Unit. Table of fan ratings Page 4 may be interpolated at 667 rpm and 1.62 HP.

The steam factor for 30°F entry temperature and 50 lb steam is given on Page 9 as 1.179. The temperature rise required of 70°F is divided by this factor to give a temperature rise for a rating of 70 ÷ 1.179 = 59.5 °F. The final temperature for use with tables is 30 + 59.5 = 89.5 °F.

At 600 fpm coil face velocity and initial temperature of 30° F, a Series 72B coil will give a final temperature of 88.1°F. This may be close enough, as the coil face area is slightly over the required size. Otherwise a 82B or 101A coil must be used. (Coil ratings Page 9). Fan ratings may be selected Pages 4 to 7.

3. Select a standard Sheldon H & V Unit using a hot water coil to following conditions: 4200 cfm 40°F entering air temperature, 700 fpm nominal face velocity, final air temperature 105°F.

In many cases, a quick selection method is entirely adequate. The Size 1-H-13 may be selected from the Table on Page 8. On Table on Page 11 for 40°F entering air and 200°F entering water indicates that a final air temperature of 107°F will be obtained with a 2-row coil. The actual air temperature will be slightly higher than 107°F

as the coil face velocity is somewhat lower than the 700 fpm used as a basis of selection.

4. A hot water coil may also be selected using the chart on Page 11. Select a unit to handle 3500 cfm at 1¼" SP. Temperature rise required is from 55°F entering to 85° leaving, using water at 200°F.

For the quick selection table use 1-H-12 unit with 5.2 square feet nominal coil face area. The actual coil face area for a water coil is slightly larger (5.6 sq ft Table Page 13) giving a coil face velocity of 615 fpm.

Total Heat Load (See Formula)
 = 3500 x 1.087 (85-55) = 114000 BTU/hr

$$\text{Water temperature drop} = \frac{114000}{10 \times 500} = 23^\circ \text{F}$$

(Base GPM = 10, Table Page 10)

$$\text{Water Velocity through Tubes} = \frac{\text{GPM} \times 1.235 \times 2^*}{N} = 1.648 \text{ fps}$$

(N = 15 (from table P. 13))

From K curve Page 12 enter at the right at average water temperature of 188.5, move horizontally to left to 1.648 fps water velocity, vertically downward to 625 fpm coil face velocity and find K = 212 at left.

MED (Chart Page 10) = 117

$$\text{Rows Deep} = \frac{114000}{117 \times 212 \times 5.6} = 0.82 \text{ rows.}$$

Use a single-row Type CH water coil.

*NOTE: ½ Circuit coils are used in 1-row and full circuit coils are normally used in 2-row water coils. In half circuit coils the water velocity is doubled.

The fan performance may be selected by interpolating the figures given for the 1-H-12 unit Page 4. The speed will be 1094 rpm and the horsepower 1.71.

For precise work, correction charts for water coils are given Page 11. Water head loss through the coils is tabulated Page 10.

EVEN - TEMP MIXING BOX

EVEN-TEMP MIXING BOX

To meet the need for improved mixing of the fresh and return air in heating, ventilating and air conditioning units, Sheldons have designed the EVEN-TEMP Mixing Box to provide practically 100% uniform temperature air across the entire outlet area of the mixing box, under almost any condition of fresh or return air.

Sheldons EVEN-TEMP mixing box has a maximum temperature gradient of 3° to 6°F across the whole discharge area, over the range from 5% to 75% fresh air, with fresh air entering at 0°F. Variations in fresh air temperature from -15°F to +10°F have no measurable effect on the final temperature gradients.

Special internal baffles and carefully placed air passages have been effectively designed to force the hot and cold air streams into direct contact with each other and thus achieve complete and thorough mixing.

Mixing can be obtained with either one or two stages of baffling, depending on the desired conditions and the space available. Tests on several different configurations of baffles showed that complete mixing of fresh air and return air down to 5° temperature gradient could not be achieved with a single stage mixing box.

SINGLE-STAGE UNIT — This design provides very good mixing of the two air streams, giving a maximum temperature gradient of about 15°F as shown in Fig. 1. This is achieved with a short box and may be satisfactory when space is limited.

TWO-STAGE UNIT — Where an improved temperature gradient is required, the addition of a second stage of baffles completes the intimate mixing of the air stream and effectively reduces

the maximum temperature gradient to approximately 5°F as shown in Fig. 1.

NOTE: To obtain the results indicated in Fig. 1, the fresh air **MUST ALWAYS ENTER ABOVE THE HORIZONTAL CENTRE-LINE**. Four alternate positions of FA and RA supply connections are available as shown.
